

# NetWrix Inactive Users Tracker

Automatic detection and deactivation of inactive user accounts

## Product Overview

Inactive user accounts can impose significant security risks if not disposed in a timely manner. It is recommended to disable user accounts of fired employees, contractors, and temporary employees as soon as they leave an organization, but in real life, IT departments are usually the last to know when somebody quits and therefore leave all such accounts enabled and exposed to unauthorized use and external attacks.

Inactive Users Tracker automates the management of inactive user accounts. Every day, the product reports all accounts that have been inactive for more than a specified number of days and allows the automated deactivation of such accounts.

## Key Benefits

### • Automated account life-cycle management

Armed with this product, IT and HR departments do not need to implement costly and error-prone user de-provisioning procedures for employee resignation, leaving old accounts enabled and exposed to malicious usage.

### • Improved security

The reporting feature allows administrators to quickly analyze unused accounts and prevent break-ins into enterprise networks. For example, someone can create a user account, leave it untouched for many days, and then use it to perform malicious activity against an organization.

### • Regulatory compliance

Major compliance regulations, such as SOX, HIPAA, and PCI, and government regulators such as FDIC require implementation of policies against unauthorized use. The product helps to implement these policies in a very easy and cost-effective way and streamlines creation of reports for auditors.

### • Ease of deployment

The product is very easy to install and use, requiring just a few simple steps to get it working, without ongoing maintenance activities. The default setup establishes scheduled reporting and an optional set of deactivation actions.

Simple

“NetWrix Inactive Users tracker has allowed us to easily automate the account cleanup process and free up valuable engineering hours.”

*Joseph Ciccolo,  
IT Manager, Boston Medical Center*

Efficient

“We’re very happy with how NetWrix Inactive Users Tracker is working, and has literally saved us hours (days?) of work tidying up our Active Directory, so now our auditors are happy too!”

*Nigel Bates, IT Support Manager,  
North Warwickshire Borough Council*

Affordable

“I realized that this tool could be used to solve our problem that stemmed from the high volatility of our user base. The product was very easy to set up, and the price we paid was very affordable.”

*Shay Wilson,  
Network Administrator of the Alaska  
State Legislature IT Department*

## Key Features

- **Generates daily reports for administrators**

The product sends automated daily summary reports by e-mail to administrators about all inactive user accounts. Reports include information about all inactive users, inactivity time, and actions performed against these users.

- **Automatically deactivates user accounts**

The product provides a number of account deactivation actions, which can be applied automatically based on inactivity thresholds. Inactive user accounts can be automatically disabled, assigned a random password, or deleted after being inactive for a specified number of days.

- **Allows customizable reports**

Reports generated by the product can be customized according to specific requirements. Report header, contents, and footer can be changed based on custom HTML templates.

- **Notifies managers about inactive direct reports**

The product can be configured to send automatic notifications about inactive subordinate user accounts to managers according to the current subordination hierarchy set in Active Directory. Notifications can be customized and include specific information about users (such as name, employee ID, location, etc.).

- **Detects inactive computer accounts**

Stale computer accounts for retired servers and workstations can also be dangerous to system security and clutter Active Directory. NetWrix Inactive Users Tracker has an option to detect and report inactive computer accounts and apply the same set of deactivation actions.

## The Challenge

Many corporate security policies and compliance regulations require that Active Directory user accounts must be disabled after a certain period of inactivity; however the IT department is usually the last to know about terminated employees.

## The Solution

NetWrix Inactive Users Tracker automates the management of inactive user accounts. The program periodically checks all user accounts in specified domains and reports all accounts inactive for more than specified number of days.
