## ACCESS RIGHTS CONNECTORS

### FLEXIBLE ACCESS AUDITING ACROSS ANY PLATFORM

Organizations of all sizes struggle to achieve a singular and comprehensive view of the many data resources their users have access to. The result is a general inability for these organizations to manage access entitlements at the levels needed to effectively mitigate the risks of data breach and satisfy compliance requirements.

### A MULTIFACETED PROBLEM

For Administrators, 3rd-Party solution providers don't provide support for all the platforms they're forced to manage, as support for any particular content repository is often dictated by market share and customer demand. If the platform isn't widely used or demand for coverage is low, it's unlikely support will be developed. Additionally, the security models of the content repositories themselves are often different from one another, making the assessment, normalization, reporting, and governance of access rights highly challenging.

As a result, Administrators are most often incapable of achieving a consolidated view of what their users have access to, increasing the risk of undesirable security, compliance, and operational outcomes. Adding insult to injury, they're also then forced to leverage a large number of administrative portals to make ends meet, making access management highly manual and error prone.

### A UNIQUE, FLEXIBLE SOLUTION

STEALTHbits' App Catalog contains a collection of data access "connectors" for content repositories not natively supported within STEALTHbits' StealthAUDIT® Management Platform. Once validated by STEALTHbits, connectors are posted online and shared with the entire STEALTHbits community, free for licensed StealthAUDIT users. The connectors and the data they collect are subsequently displayed within StealthAUDIT's Access Information Center (AIC) or used for custom reporting within StealthAUDIT.

### KEY FEATURES & BENEFITS

#### Single Pane of Glass Visibility

STEALTHbits' Access Rights connectors provide a way for organizations to automate the collection, normalization, and reporting of resource access rights across virtually any resource within a single management framework. The result is a single view of a user's access across everything within an enterprise, whether on-premises or in the cloud.

#### Permissions Auditing

Understanding how users are granted access across multiple scopes is important in understanding how identities have access to content. STEALTHbits' Access Rights connectors allow for a point-in-time snapshot of permissions within a configured platform that can be easily visualized at any scope.

#### Ready-to-Run, yet Customizable

Leveraging a vendor-supplied set of resource connectors allows users to get up and running quickly. However, simple, PowerShell-based construction allows each connector to be customized to fit any environment or built to accommodate even the most obscure data repositories, including homegrown applications.

#### Online Community

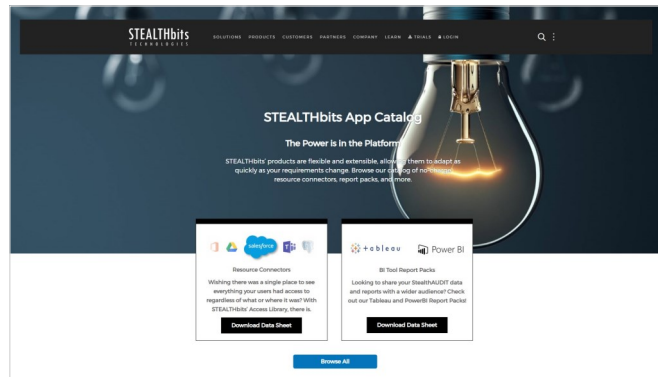

While STEALTHbits builds and publishes connectors of their own, users can also build and share their own connectors with the community at large.

## SAMPLE CONNECTORS

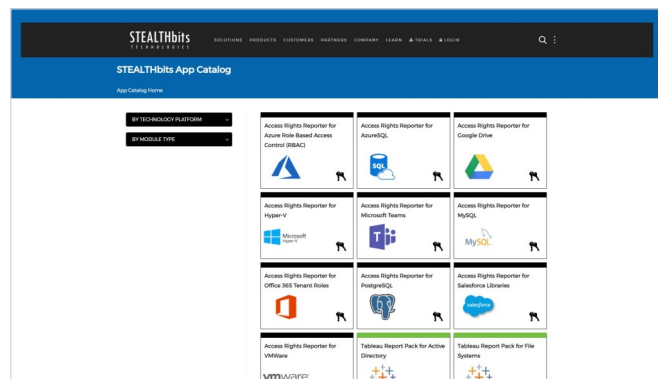

## SIMPLE AS 1-2-3

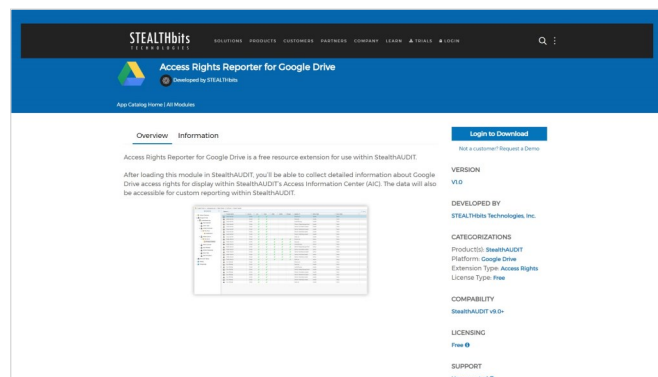

1. Visit [www.stealthbits.com/stealthbits-app-catalog](http://www.stealthbits.com/stealthbits-app-catalog)

2. Browse our library of connectors

3. Download a connector of your choice
